

P-LINE

MOTOR CONTROLLERS & ELECTRONIC CONTACTORS

POWER CONTROL

IC ELECTRONIC A/S

www.ic-electronic.com

IC ELECTRONIC was established in 1995 and the company has set-up a new and innovative standard in industrial semiconductor technology founded on the knowledge of its experienced and skilful team of employees.

The research and development is a combination of many years of experience within the field of power electronics and industrial applications.

IC ELECTRONIC has developed a unique programme of electronic contactors and motor controllers.

The product range is sold under the name of P-Line or as private labelled in more than 130 countries world-wide.

QUALITY

Our research and development activities combine experience and ingenuity in extending technological boundaries in new products as well as existing ones. Quality is integrated in design and production. The direct copper bonded ceramic base makes a stable connection for the semiconductor chip.

MISSION

As a world class manufacturer our mission is to design, produce and sell advanced power electronics, semiconductor contactors and motorcontrollers for power and motor applications to the industry ALL OVER THE WORLD

IC-ELECTRONIC is owned by Montra Foundation

TECHNOLOGY

We have implemented the latest technology in design and manufacturing of power electronics. The products meet the requirements of international standards EN 60947-4-2 / EN 60947-4-3) and are approved according to CE and cULus.

IC Electronic A/S is
ISO 9001 Certified.

APPLICATIONS

Our range of products offer solutions for almost any power control application.

The product family consists of components designed for electrically harsh industrial applications.

All necessary protection is integrated at different utilization categories.

Application guide

Soft starter for 3-phase motors

Application: Control of material transportation, conveyer, cranes, Soft Start / Soft Stop. Type SMC 3/33
Further information on page: 6-11

Soft starter with dynamic brake for 3-phase motors

Application: Soft Start and braking of e.g. woodworking machines. Type SMBC3.
Further information on page: 14-15

Reversing of 3-phase motors

Application: Control of material transportation, conveyer cranes. Reversing. Type SRC3.
Further information on page: 18-19

Inching and jogging of 3-Phase motors

Application: Control of general machine positioning. Direct On Line Start (DOL) for inching, jogging and frequent switching. Type SMC3 DOL.
Further information on page: 20-21

Starting torque limiter for 3-phase motors

Application: General machine positioning, Soft Start, reduction of mechanical shock. Type STL3.
Further information on page: 12-13

Starting torque limiter for 1-phase motors

Application: General machine positioning, reduction of mechanical shock. Type STL1.
Further information on page: 12-13

Electronic contactor for 3-phase motors

Application: Control of general machine positioning, frequent switching. Type SC3.
Further information on page: 34-35

Electronic contactor for 1-phase motors

Application: Control of general machine positioning, frequent switching. Type SC1.
Further information on page: 22-23

Electronic contactor for heating control 1-ph.

Application: Switching of 1-phase heaters in industrial temperature applications. Type SC1 / RC11
Further information on page: 22-25

Electronic contactor for heating control 3-ph. (with neutral)

Application: Switching of 3-phase heaters in industrial temperature applications 3-phase with neutral. Type SC1x3 / RC11x3
Further information on page: 22-25

Electronic contactor for heating control 3-ph. (without neutral)

Application: Switching of 3-phase heaters in industrial temperature applications 3-phase without neutral. Type SC1x3 / RC11x3
Further information on page: 22-25

Electronic contactor for heating control 3-ph. (without neutral)

Application: Switching of 3-phase heaters in industrial temperature applications 3-phase without neutral. Economical circuit, two phases switched. SC1x2/SC2x1. og RC11x 2 /RC22x1 / RC32x1. Further information on page: 22-25 / 28-33

Application guide

Electronic contactor for heating control 3-ph. (without neutral)

Application: Switching of 3-phase heaters in industrial temperature applications without neutral. Economical circuit, two phases switched. Type SC1x2 / SC2x1. RC11x1 / RC22x1 / RC32x1. Further information on page: 22-25 / 28-33

Electronic contactor for heating control 3-ph. (with neutral)

Application: Switching of 3-phase heaters On/Off in industrial temperature applications 3-phase with neutral. Type SC3 / RC33. Further information on page: 34-37

Electronic contactor for heating control 3-ph. (without neutral)

Application: Switching of 3-phase heaters in industrial temperature applications 3-phase without neutral. Type SC3 / RC33. Further information on page: 34-37

Electronic contactor for heating control 1-ph.

Application: Switching of 1-phase heaters On/Off in domestic temperature applications EN50081-1/ EN50082-2. Type SC1L. Further information on page: 26-27

Electronic contactor for heating control 3-ph. (with neutral)

Application: Switching of 3-phase heaters On/Off in domestic temperature applications EN50081-1/ EN50082-2. Type SC1Lx3. Further information on page: 26-27

Electronic contactor for heating control 3-ph. (without neutral)

Application: Switching of 3-phase heaters On/Off in domestic temperature applications EN50081-1 / EN50082-2. Type SC1Lx3. Further information on page: 26-27

Analogue control of 1ph. heaters

Application: Analogue control of 1-phase heaters in phase angle or burst firing mode. Type SPC1. Further information on page: 38-41

Analogue control of 3-ph. heaters (with neutral)

Application: Analogue control of 3-phase heaters in phase angle mode. Type SPC1x3. Further information on page: 38-41

Analogue control of 3-ph. heaters

Application: Analogue control of 3-phase heaters with 1-pole contactor. Type SPC1x1/SC1x1 in slave circuit and burst firing mode. Further information on page: 38-41 / 22-25

Control of incandescent or metal vapour lamps

Application: Lamp load analogue control of incandescent lamps. Type SPC1 or type SC1. Further information on page: 38-41

Soft start of 3-ph. or On/Off control 1-ph. transformer

Application: Transformer load control of 3-phase transformer with soft start. Type SMC. Transformer load controlled of 1-phase electronic contactor. Type SC1. Further information on page: 6-11 / 22-23

Analogue control of 1-ph. transformers

Application: Transformer load controlled of 1-phase analogue power controller. Type SPC1. Further information on page: 38-41

Soft Starter (SMC 33 / three controlled phases)

- Rated operational voltage up to 480 VAC 50/60Hz
- Rated operational current up to 86A (inside delta DBP)
- Output signal for By-Pass and Start/Stop
- Ramp Up and Down time adjustable
- Initial Torque adjustable with kick start
- Wide control voltage range
- Meets EN 60947-4-2 requirements
- High number of start/stop operations pr. hour. See data.

Item selection and technical specifications (see also motor table at page 11)

Load ratings 1 Inside delta configuration	Item number by 208-240VAC 50/60Hz Line Voltage	Item number by 400-480VAC 50/60Hz Line Voltage	Item number by 550-600VAC 50/60Hz Line Voltage	Ramp- Up / Down adjustment	Torque adjustment	Module- width

Load specified with utilisation category AC-53a

SMC 33 DA XXXX **BP** AC-53a: No by-pass contactors is necessary during running, shall be connected as inline configuration

SMC 33 DA XXXX **DBP** AC-53a: No by-pass contactors is necessary but motor shall be connected in an inside-delta configuration

Load specified with utilisation category AC53b

SMC 33 DA XXXX **BP** AC-53b: By-pass contactor shall be used for bypassing the soft starter during running, shall be connected as inline configuration

SMC 33 DA XXXX **DBP** AC-53b: By-pass contactor shall be used and motor connected in an inside-delta configuration

Output load specification (90mm module) more info page 45

Overload current profile AC-53a (without by-pass contactor)	X-Tx:6-5 : 100-120
Overload current profile AC-53b (with by-pass contactor)	X-Tx:5-5 : 30
Overload relay trip class AC-53a/AC53b	10 or 10A

Leakage current: 5mA ACmax. Min. operational current: 50mA

Output load specification (180mm module) more info page 45

Overload current profile AC-53a (without by-pass contactor)	X-Tx:6-6 : 100-120
Overload current profile AC-53b (with by-pass contactor)	X-Tx:6-6 : 30
Overload relay trip class AC-53a/AC53b	10 or 10A

Leakage current: 5mA ACmax. Min. operational current: 50mA

Control terminal specifications

Control voltage by line voltage 208-240VAC A1-A2	24 - 230 VAC/DC
Control voltage by line voltage 400-600VAC A1-A2	24 - 480 VAC/DC
Pick-up voltage max.	20.4 VAC/DC
Drop-out voltage min.	5 VAC/DC
Max. control current for no operation	1mA
Response time max.	70msec.
Control current / power max.	15mA / 2VA

Auxiliary contacts

Terminal: 13-14, AC SCR output for start/stop function,
Terminal: 23-24, AC SCR output for connection of by-pass contactor.

Output specifications for 90mm module: AC SCR: 0.5A AC-14, AC15
24-230/480V AC 50-60Hz Fusing: gl/gG Max i^2t 72A²S

Output specifications for 180mm module: AC SCR: 1.0A AC-14, AC15
24-230/480V AC 50-60Hz Fusing: gl/gG Max i^2t 72A²S

Terminal: 11-12, have no connection with the internal circuit. Can be used in conjunction with a thermal overload protection or for other wiring purposes. See under general technical information.

Thermal specification

Power dissipation for continuous operation PDmax	3 W/A without BP
Power dissipation with semiconductor by-passed	5 W Max. with BP
Cooling method	Natural convection
Mounting	Vertical +/-30°
Operating temperature range EN 60947-4-2	-5°C to 40°C
Max. operating temperature with current derating	60°C
Storage temperature EN 60947-4-2	-20°C to 80°C

Operation in ambient temperatures exceeding 40°C is possible if the power dissipation is limited either by reducing the steady-state current or by reducing the duty-cycle of the soft starter as shown in the table. Max.cycle time 15min.

By 40°C	By 50°C	By 60°C

Soft Starter (SMC 33 / three controlled phases)

Wiring specifications (90mm module)

Wiring specifications (180mm module)

Wiring information: Delta configuration

Standard wiring of a softstarter to a 3-phase motor in delta configuration.

Wiring information: Inside-delta configuration

Inside-delta wiring of a softstarter to a 3- phase motor.

Wiring example Start/Stop - By-pass (90 mm modul)

Auxiliary SCR output contact 13-14 (AC voltage only) is used for controlling a Start-Stop function directly wired to the soft starter.
Auxiliary SRC output contact 23-24 (AC voltage only) is activated when the ramp-up time has elapsed. Is used for by-passing the soft starter with an external connected electromechanical contactor.

Wiring example Start/Stop - By-pass (180 mm modul)

Auxiliary SCR output contact 13-14 (AC voltage only) is used for controlling a Start-Stop function directly wired to the soft starter.
Auxiliary SRC output contact 23-24 (AC voltage only) is activated when the ramp-up time has elapsed. Is used for by-passing the soft starter with an external connected electromechanical contactor.

Short-circuit protection by circuit breaker or fuses

Two type of short-circuit protection can be used:

- Short-circuit protection by circuit breaker.
- Short-circuit protection by fuses.

Short-circuit protection is divided into 2 levels **Type 1** or **Type 2**

Co-ordination Type1: Short-circuit protects the installation

Co-ordination Type 2: Short-circuit protects the installation and the semi-conductors inside the motor controller

a) Short-circuit protection

Co-ordination type 1 will be obtained when using magnetic circuit breakers or standard gL/GI fuses.

Co-ordination type 2 will be obtained when using semiconductor fuses. When using semiconductor fuses the SCR will not be damaged due to transients and short circuits. The table indicates suitable fuses for co-ordination type 2 protection.

b) Short-circuit protection by fuses

Type 1: SMC 33 DA XX15	Protection max. 50 A gL/gG
Type 1: SMC 33 DA XX25 BP	Protection max. 80 A gL/gG
Type 1: SMC 33 DA XX40 DBP	Protection max. 80 A gL/gG
Type 1: SMC 33 DA XX50 BP	Protection max. 125 A gL/gG
Type 1: SMC 33 DA XX85 DBP	Protection max. 125 A gL/gG
Type 2: SMC 33 DA XX15	Protection max. i _{2t} of the fuse 1800 A ² S
Type 2: SMC 33 DA XX25 BP	Protection max. i _{2t} of the fuse 6300 A ² S
Type 2: SMC 33 DA XX40 DBP	Protection max. i _{2t} of the fuse 6300 A ² S
Type 2: SMC 33 DA XX50 BP	Protection max. i _{2t} of the fuse 25300 A ² S
Type 2: SMC 33 DA XX85 DBP	Protection max. i _{2t} of the fuse 25300 A ² S

Fuses from e.g. Ferraz, Siba, Bussmann can be used as short-circuit protection Type 2

More information concerning Co-ordination Type 2 see page 45

Approval

cUL Std No. 508 (Not approved SMC 33 DA XX50BP and SMC 33 DA XX85DBP)

Application, adjustment hints and general specifications

See page 10-11 / 44-45

Soft Starter (SMC 3 / SMC 32 two controlled phases)

- Rated operational voltage up to 600 VAC 50/60Hz
- Rated operational current up to 25A/30A
- Output signal for By-Pass and Start/Stop
- Ramp Up and Down time adjustable
- Initial Torque adjustable with kick start
- Wide control voltage range
- Meets EN 60947-4-2 requirements
- High number of start/stop operations pr. hour. See data

Soft Starter (SMC 3 / SMC 32 two controlled phases)

Wiring specifications

SMC 3 DA XX03 SMC 32 DA XX15BP

Control voltage A1-A2

SMC 3 DA XX15/25 11-12: for UP62 or other wiring purposes

SMC 3 DA XX25 BP

11-12: for UP62 or other wiring purposes

Control voltage A1-A2 Output 13-14: For control of Start/Stop function Output 23-24: By end of ramp up time for by-pass contactor

Wiring example Start/Stop-By-pass (SMC 3 DA XX25 BP)

Auxiliary SCR output contact 13 - 14 (AC voltage only) is used for controlling a Start-Stop function directly wired to the soft starter. Auxiliary SRC output contact 23-24 (AC voltage only) is activated when the ramp-up time has elapsed. Is used for by-passing the soft starter with an external connected electromechanical contactor.

Motor wiring with or without by-pass (SMC 3 DA XX25 BP)

Standard wiring of a softstarter to a 3-phase motor in delta configuration.

Short-circuit protection by circuit breaker or fuses

Two type of short-circuit protection can be used:

- a) Short-circuit protection by circuit breaker.
- b) Short-circuit protection by fuses.

Short-circuit protection is divided into 2 levels **Type 1** or **Type 2**

Co-ordination Type 1: Short-circuit protects the installation

Co-ordination Type 2: Short-circuit protects the installation and the semi-conductors inside the motor controller

a) Short-circuit protection

Co-ordination type 1 will be obtained when using magnetic circuit breakers or standard gI/GI fuses.

Co-ordination type 2 will be obtained when using semiconductor fuses.

When using semiconductor fuses the SCR will not be damaged due to transients and short circuits. The table indicates suitable fuses for co-ordination type 2 protection.

b) Short-circuit protection by fuses

Type 1: SMC 3 DA XX03	Protection max. 25 A. gL/gG
Type 1: SMC 32 DA XX15 BP	Protection max. 50 A. gL/gG 63A T
Type 1: SMC 3 DA XX15	Protection max. 50 A. gL/gG 63A T
Type 1: SMC 3 DA XX25	Protection max. 80 A. gL/gG 63A T

Type 2: SMC 3 DA XX03	Protection max. i^2t of the fuse 72 A ² S
Type 2: SMC 32 DA XX15 BP	Protection max. i^2t of the fuse 1800 A ² S
Type 2: SMC 3 DA XX15	Protection max. i^2t of the fuse 1800 A ² S
Type 2: SMC 3 DA XX25	Protection max. i^2t of the fuse 6300 A ² S
Type 2: SMC 3 DA XX25 BP	Protection max. i^2t of the fuse 6300 A ² S

Fuses from e.g. Ferraz, Siba, Bussmann can be used as short-circuit protection Type 2

More information concerning Co-ordination Type 2 see page 45

Approval

cUL Std No. 508

Application, adjustment hints and general specifications

See page 10-11 / 44-45

Dimensions (see also page 44)

Type	H	D	W
22.5 mm module	94 mm	123.8 mm	22.5 mm
45 mm module	94 mm	128.1 mm	45 mm
90 mm module	94 mm	128.1 mm	90 mm

Application, adjustment hints and general specifications for SMC 3/32/33

Input controlled soft-start

When the control input is switched to the ON-state (S closed) the motor controller will soft start the motor according to the settings of the ramp-up time and initial torque adjustments.

When the control input is switched to the Off-state (S open) the motor will be switched Off instantaneously only if the Ramp-Down time is adjusted to 0.

With any other setting the motor will be soft stopped according to the settings of the Ramp-Down time adjustment.

*Use UL approved Magnetic Circuit Breaker or UL specified back-up fuse type K5 or H Class

Line controlled soft-start

When the contactor C1 is switched to the ON-state, the motor controller will soft start the motor according to the settings of the ramp-up time and initial torque adjustments.

When the contactor C1 is switched to the OFF-state, the motor will be switched Off instantaneously.

In this application the contactor will have no load during making operation. The contactor will carry and break the nominal motor current when switching off.

*Use UL approved Magnetic Circuit Breaker or UL specified back-up fuse type K5 or H Class

*UL: Use thermal overload protection as required by the National Electric Code. When protected by a non-time delay K5 or H Class fuse, rated 266% of motor FLA, this device is rated for use on a circuit capable of delivering not more than 5,000 rms. symmetrical amperes, 600 V maximum. Maximum surrounding temperature 40°C.

Thermal overload protection (see also page 44)

Optional thermal overload protection is possible by inserting a thermostat in a slot on the right hand side of the soft starter. Type number UP62

The thermostat can be connected in series with the control circuit of the soft starter.

When the temperature of the heatsink exceeds 90°C the soft starter will switch Off.

Note: When the temperature has dropped approx. 30°C the soft starter will automatically be switched on again.

The thermostat is connected in series with the control circuit of the main contactor.

Note: When the temperature of the heatsink exceeds 90°C the main contactor will switch Off. A manual reset is necessary to restart this circuit.

Dimensions (see also page 44)

Type	H	D	W
22.5 mm module	94 mm	123.1 mm	22.5 mm
45 mm module	94 mm	128.1 mm	45 mm
90 mm module	94 mm	128.1 mm	90 mm
180 mm module	140 mm	144.8 mm	180 mm

Combining Reversing Electronic Contactor & Soft Starter

Soft-reversing of motors up to 10A

A Soft-Reversing of a motor can easily be achieved by connecting a reversing relay to the Soft Starter. The reversing relay type SRC 3 DX will determine the direction of rotation Forward or Reverse and the Soft Starter type SMC 3/32/33 will perform soft-starting and soft-stopping of the motor.

If soft-stop is not required the application can be simplified by connecting the control circuit of the Soft Starter to the main terminals as shown under Line Controlled Soft-Start. A delay of approx. 0.5 sec. between forward and reverse control signal must be allowed to avoid influence from the voltage generated by the motor during turn Off.

Combining reversing mechanical contactor & soft starter

Soft-reversing of motors up to 85A

A Soft-Reversing of motors can easily be achieved when the motor load exceeds 10A by connecting a mechanical reversing contactor to the Soft Starter. The reversing contactor will determine the direction of rotation forward or reverse and the Soft Starter type SMC3/32/33 will perform soft-starting and soft-stopping of the motor.

If the contactors are always switched in no load conditions the lifetime of the contactors will normally exceed 10 million cycles.

Insulation specifications

Rated insulation voltage	Ui 660 Volt
Rated impulse withstand voltage	Uimp. 4 kVolt
Installation category	III

Environment

Degree of protection	IP 20	Pollution degree	3
----------------------	-------	------------------	---

EMC

These components meets the requirements of the product standard EN60947-4-2 and is CE marked according to this standard.

They are designed for class A equipment. Use of the product in domestic environments may cause radio interference, in which case the user may be required to employ additional mitigation methods.

Functional diagram

Output: Terminal 13-14 Start-Stop (AC voltage only)

For control of Start-Stop function directly wired to the soft starter

Output: Terminal 23-24 By-Pass (AC voltage only)

For signalling Full-On state. By-Pass in AC-53b operation

LED information:

Note: When both LED's are flashing, no connection to the motor (SMC 3 only)

Note: When both LED's are flashing, one phase is missing (SMC 33 only)

Mounting and cable wiring information

Mounting information see page 44
Cable wiring see page 45

Application, adjustment hints and general specifications for SMC 3/32/33

How to adjust ramp times and initial torque

A. Ramp-Up time and initial torque (standard load)

- A1) Set the *Ramp-Up* switch to maximum.
- A2) Set the *Ramp-Down* switch to minimum.
- A3) Set the *Initial Torque* switch to minimum.
- A4) Apply control signal for a few seconds.
If the load does not rotate immediately increment the *Initial Torque* and try again. Repeat until the load starts to rotate immediately on start-up.
- A5) Adjust *Ramp-Up* time to the estimated start time (scale is in seconds) and start the motor.
- A6) Decrease the *Ram-Up* time until mechanical surge is observed during start.
- A7) Increase the time one step to eliminate the surge.

B. Kick-Start / Break loose. High inertia loads.

If it is not possible to reach a time sufficient for the application (step A7) it may be necessary to kick-start the load.

- B1) Set the *Ramp-Up* switch to maximum.
- B2) Set the *Ramp-Down* switch to minimum.
- B3) Set the *Initial Torque* switch to minimum Kick-start torque.
- B4) Apply control signal for a few sec. If the load stops right after the 200 ms "kick" increment the initial torque and try again. Repeat until the load continues to rotate after the "kick"
- B5) Adjust *Ramp-Up* time to the desired start time (the scale is in seconds) and start the motor.

C. Ramp-Down time. E.g. Pump loads

Follow procedure A or B to set *Ramp-Up* and *initial torque*

- C1). Set the *Ramp-Down* switch to maximum.
- C2) Switch off the control voltage and observe any mechanical surges on the load. If none decrement *Ramp-Down* switch and try again. Repeat until mechanical surges on the load is observed.
- C3) Increase the time one step to eliminate the surge.

Note:

- a) Control of the motor torque is achieved by acting on the motor voltage. The motor speed depends on the torque produced by the motor and the load on the motor shaft.
- b) A motor with little or no load will reach full speed before the voltage has reached its maximum value.
- c) The soft starter will read time and torque settings in the off state. Repeated starts may trip the motor protection relay.
- d) Make sure NOT to set the rotary switches in between positions as this corrupts the time and torque adjustment. Use screwdriver 2 mm x 0.5 mm

EMC

This component meets the requirements of the product standard EN60947-4-2 and is CE marked according to this standard. These products has been designed for class A equipment. Use of the product in domestic environments may cause radio interference, in which case the user may be required to employ additional mitigation methods.

Starting Torque Limiter (STL Soft Starter for 1&3-phase motors, one controlled phase)

Wiring specifications

How to adjust ramp times and initial torque

A. Ramp-Up time and initial torque (standard load) Use screwdriver 2 mm x 0.5 mm for adjustment

- 1) Set the *Ramp-Up* switch to maximum
- 2) Decrease the *Ram-Up* time until desired start is achieved
- 3) Set the *Initial Torque* switch to minimum
- 4) Switch the contactor ON for a short time. If the load does not rotate immediately increment the *Initial Torque* and try again. Repeat until the load starts to rotate immediately on start-up

NOTE:

- a) Control of the motor torque is achieved by acting on the motor voltage. The motor speed depends on the torque produced by the motor and the load on the motor shaft.
- b) A motor with little or no load will reach full speed before the voltage has reached its maximum value.
- c) Repeated starts may trip the motor protection relay.

Short-circuit protection by circuit breaker or fuses

Two type of short-circuit protection can be used:

- a) Short-circuit protection by circuit breaker.
- b) Short-circuit protection by fuses.

Short-circuit protection is divided into 2 levels Type 1 or Type 2

Co-ordination Type 1: Short-circuit protects the installation

Co-ordination Type 2: Short-circuit protects the installation and the semiconductor inside the motor controller

a) Short-circuit protection

Co-ordination type 1 will be obtained when using magnetic circuit breakers or standard gL/GI fuses.

Co-ordination type 2 will be obtained when using semiconductor fuses. When using semiconductor fuses the SCR will not be damaged due to transients and short circuits. The table indicates suitable fuses for co-ordination type 2 protection.

b) Short-circuit protection by fuses

Type 1: STL 1/3 XX15 Protection max. 50 A gL/gG
Type 1: STL 1/3 XX25 Protection max. 80 A gL/gG 63A T

Type 2: STL 1/3 XX15 Protection max. i^2t of the fuse 1800 A²S
Type 2: STL 1/3 XX25 Protection max. i^2t of the fuse 6300 A²S

Fuses from e.g. Ferraz, Siba, Bussmann can be used as short-circuit protection Type 2

More information concerning Co-ordination Type 2 see page 45

Start of single phase motor (application example)

- By start S shall be switched On
- The STL starts to Ramp-Up the motorvoltage
- When the motor has to stop, S shall be switched off
- The STL 1 is now ready for a new start
- The STL 1 is applicable for standard single phase motors, capacitive motors, transformers etc.

Thermal overload protection (see also page 44)

Optional thermal overload protection is possible by inserting a thermostat in a slot on the right hand side of the soft starter. Type number UP62

Soft Starter with Dynamic Brake (SMBC 3 two controlled phases)

- Rated operational voltage up to 480VAC 50/60Hz
- Rated operational current 1-25A
- Output signal for By-Pass and control of mechanical brake
- Ramp Up time and initial torque adjustable with kick start
- Adjustable Brake current
- Automatic stop detection
- Fast action brake mode with automatic motor field reduction
- Meets EN 60947-4-2 requirements

Item selection and technical specifications (see also motor table at page 11)

Soft Starter with Dynamic Brake (SMBC 3 two controlled phases)

Wiring diagram

Wiring example: automatic brake to stop function

Set Ramp-Up and Initial Torque adjustments for best start-up function. Adjust brake torque to reach a complete stop after each working cycle

Wiring example: DC brake current configuration

To achieve maximum brake torque the DC current is applied on all 3 motor windings. Direction of current is from T1 to T2 and T3.

Do not open any switches in the DC current path during the braking cycle as this might cause severe burning of the contacts.

Wiring example: Timer controlled brake cycle

If the application only can accept a low braking torque below the sensing range of the stop detection it is possible to connect an external "delay on" operate timer to the Brake control input.

Functional description:
When control relay d1 and Run input is switched off timer T1 will activate the Brake input for the adjusted time.

Adjusting the brake current (connexion between brake torque, setting, brakecurrent and braketime)

When the Brake current is set it is actually a DC voltage that is adjusted. The current is therefore depending on the ohmic resistance of the windings and the actual connection of the motor (Delta).

For small motors a high DC voltage is necessary and for bigger motors a low voltage can produce sufficient brake current. Therefore the brake current must be adjusted for the actual application.

Before start-up of an unknown application set the Brake Torque adjustment to 1. Increase until the desired stop time is achieved.

If it is impossible to reach a time long enough for the application an external timer must be connected. See also application information next page.

Automatic stop detection

The motor speed is detected by sensing the DC brake current. As this controller can operate a wide range of motors with different wiring configurations, the ohmic resistance of the actual motor has a wide range, it is therefore necessary to adjust the "Brake Torque" (DC Brake current) to achieve correct function in the actual application.

If the current is set to a low value the brake will be switched off before the motor has come to a complete stop. If the current is set too high, it will be out of the detection range and cannot be switched off before end of the build-in maximum time (30 sec.).

The LED's will flash to indicate failure condition. The mains must be switched off and reapplied to reset this condition

CAUTION ! For bigger motors the current can be adjusted to a value that will destroy the controller or open the circuit breaker or fuse.

Before start-up of an unknown application set the Brake Torque adjustment to 1. To measure the Brake current activate the Brake Control input.

The DC brake current can be measured on the out put of T1 only. The AC value of the Brake current can be measured in L1 or L2. The DC current is approx. 1,5 times the AC current.

Functional diagram

Basic application.

When the control voltage is applied the motor will soft-start. When the control voltage is switched off the automatic Brake cycle will operate. The application shall be overload- and shortcircuit protected by fuses or circuit breaker.

Application, adjustment hints and general specifications for SMBC 3

Short-circuit protection by circuit breaker or fuses

Two type of short-circuit protection can be used:

- Short-circuit protection by circuit breaker.
- Short-circuit protection by fuses.

Short-circuit protection is divided into 2 levels **Type 1 or Type 2**

Co-ordination Type 1: Short-circuit protects the installation

Co-ordination Type 2: Short-circuit protects the installation and the semiconductors inside the motor controller

a) Short-circuit protection

Co-ordination type 1 will be obtained when using magnetic circuit breakers or standard gI/GI fuses.

Co-ordination type 2 will be obtained when using semiconductor fuses. When using semiconductor fuses the SCR will not be damaged due to transients and short circuits. The table indicates suitable fuses for co-ordination type 2 protection.

a1) Short-circuit protection by circuit breaker (continued)

It is recommended to overload protect the soft starter by a manual motor starter which is insensitive to the unbalanced operation condition during braking operation. The motor is thus protected also during the brake cycle. The manual motor starter will also short-circuit protect the Controller if prospective short-circuit limits are observed (Co-ordination 2.)

NOTE: Due to the integral brake function the motor is overload protected during the brake cycle. The phase unbalance in this mode might trip an overload relay with high sensitivity to phase unbalance.

Danfoss CTI 25 is not sensitive to unbalanced loads.

b) Short-circuit protection by fuses

Type 1: SMBC 3 DA XX25
Type 2: SMBC 3 DA XX25

Protection max. 80 A gL/gG 63A T
Protection max. i^2t of the fuse 6300 A²S

Fuses from e.g. Ferraz, Siba, Bussmann can be used as short-circuit protection Type 2

More information concerning Co-ordination Type 2 see page 45

Wiring example (Start/Stop with or without By-pass contactor)

Motor wiring with or without by-pass

Standard wiring of a softstarter to a 3-phase motor in delta configuration.

With or without by-pass contactor

Short-circuit and overload protection

*Use UL approved Magnetic Circuit Breaker or UL specified back-up fuse type K5 or H Class

Functional diagram of start-stop/control/by-pass contactor

Setting of the operation mode selector

NOTE:

When terminal 13-14 is used as Start/Stop function, and 23-24 is used for by-pass: **Set the selector in position I-0** (7.5% or 10% if slow speed is used)

When terminal 13-14 & 23-24 is used as brake control: **Set the selector in position M** (7.5% or 10% if slow speed is used)

Control of mechanical brake and by-pass contactor

Thermal overload protection (see also page 44)

Optional thermal overload protection is possible by inserting a thermostat in a slot on the right hand side of the soft starter. Type number UP62

Functional diagram of mechanical brake/by-pass contact.

Note: #1. If the motor is running when the soft starter is switched On, the Auto Brake mode will stop the rotation.

Note: #2. With "RUN" signal present on Power-Up the soft starter will start the motor.

The thermostat can be connected in series with the control circuit of the soft starter.

When the temperature of the heatsink exceeds 90°C the soft starter will switch Off.

Note:

When the temperature has dropped approx. 30°C the soft starter will automatically be switched on again.

The thermostat is connected in series with the control circuit of the main contactor.

When the temperature of the heatsink exceeds 90°C the main contactor will switch Off.

Note: A manual reset is necessary to restart this circuit.

Application, adjustment hints and general specifications for SMBC 3

How to adjust ramp time, initial torque and brake torque

A. Standard load with automatic brake cycle

- A1) Set the *Ramp-Up* switch to maximum.
- A2) Set the *Brake Torque* switch to 1
- A3) Set the *Initial Torque* switch to minimum.
- A4) Apply control signal for a few seconds.
If the load does not rotate immediately increment the *Initial Torque* and try again. Repeat until the load starts to rotate immediately on start-up.
- A5) Adjust *Ramp-Up* time to the desired starting time (scale is in seconds) is obtained.
- A6) Adjust *Brake Torque* until the desired stop time is obtained
Note. If the current is set too high, the zero speed detect will not function. If the current is set too low, the zero speed detect will not function. To achieve a longer braking time an external timer must be installed as shown in application example page 15

B. High inertia loads with stiction

If it is not possible to reach a smooth start for an application it might be it may be necessary to kick-start / Break loose function.

- B1) Set the *Ramp-Up* switch to maximum.
- B2) Set the *Brake-Torque* switch to 1.
- B3) Set the *Initial Torque* switch to minimum in the *Kick-start* mode.
- B4) Apply control signal for a few sec. If the motor stops right after the 200 ms "kick" increment the *initial torque* and try again. Repeat until the load continues to rotate after the "kick".
- B5) Adjust *Ramp-Up* time to the desired start time (the scale is in seconds) and start the motor.
- B6) Adjust *Brake Torque* until the desired stop time is obtained

LED information:

Note: When both LED's are flashing, no connection to the motor

Please note:

- a) The Soft Starter will read time and torque settings in stand by mode i.e. after the Brake cycle. Repeated starts may trip the motor protection relay.
- b) Make sure NOT to set the rotary switches in between positions as this corrupts the time and torque adjustment. Use screwdriver 2 mm x 0.5 mm
- c) Caution: Set the Brake Torque switch to 1, before switching the controller ON

CAUTION!

For bigger motors the Brake Torque can be adjusted to a value that will destroy the controller or open the circuit breaker or fuse. Only increase Brake Torque in single steps for an unknown application.

LED status indication

Slow speed-operation (functional diagram)

The Slow speed option is intended for short time operation in applications where an exact positioning is needed, for example cranes. The motor operates at full speed until the application reaches the early limit switch, where the motor is braked until stop is detected, then it will continue until final position and brake down to stop in the exact position. There is 2 selectable speeds 7,5 % and 10 % of nominal speed. **NB. Torque levels are lower than nominal torque.** In slow speed 7,5 % mode the operational current in L2 is approx. 2.5 times the nominal current. In slow speed 10 % mode the operational current in L2 is approx. 2 times the nominal current but with lower torque.

Note: RUN input signal has priority over SLOW input signal. If Brake Torque is adjusted to "0" Slow speed will be ignored.

Approval

cUL Std No. 508

*UL: Use thermal overload protection as required by the National Electric Code. When protected by a non-time delay K5 or H Class fuse, rated 266% of motor FLA, this device is rated for use on a circuit capable of delivering not more than 5,000 rms. symmetrical amperes, 600 V maximum. Maximum surrounding temperature 40°C.

Insulation specifications

Rated insulation voltage	Ui 660 Volt
Rated impulse withstand voltage	Uimp. 4 kVolt
Installation category	III

Functional diagram

EMC

This component meets the requirements of the product standard EN60947-4-2 and is CE marked according to this standard. This products has been designed for class A equipment. Use of the product in domestic environments may cause radio interference, in which case the user may be required to employ additional mitigation methods.

Dimensions (se also page 44)

3-Phase electronic reversing contactor (SRC)

Wiring specifications

SRC 3 DX 4010

11-12: for UP 62 or other wiring purposes

Control voltage A1-A2 Control voltage A3-A4

Short-circuit protection by circuit breaker or fuses

Two type of short-circuit protection can be used:

- Short-circuit protection by circuit breaker.
- Short-circuit protection by fuses.

Short-circuit protection is divided into 2 levels **Type 1** or **Type 2**

Co-ordination Type 1: Short-circuit protects the installation

Co-ordination Type 2: Short-circuit protects the installation and the semi-conductors inside the motor controller

a) Short-circuit protection

Co-ordination type 1 will be obtained when using magnetic circuit breakers or standard gL/GI fuses.

Co-ordination type 2 will be obtained when using semiconductor fuses. When using semiconductor fuses the SCR will not be damaged due to transients and short circuits. The table indicates suitable fuses for co-ordination type 2 protection.

b) Short-circuit protection by fuses

Type 1: SRC 3 DX 4010

Protection max. 50 A gL/gG

Type 2: SRC 3 DX 4010

Protection max. i^2t of the fuse 610 A²S

Fuses from e.g. Ferraz, Siba, Bussmann can be used as short-circuit protection Type 2

More information concerning Co-ordination Type 2 see page 45

Overload Protection in Motor Control Reversing

Overload protection of the motor is easily achieved by installing a manual thermal magnetic circuit breaker on the supply side of the motor.

The circuit breaker provides means for padlocking and the necessary clearance for use as a circuit isolator according to EN 60204-1.

Adjust the current limit on the MCB according to the rated nominal current of the motor

*Use UL approved Magnetic Circuit Breaker or UL specified back-up fuse type K5 or H Class

Combining Reversing Electronic Contactor & Soft Starter

Soft-reversing of motors up to 10A

A Soft-Reversing of a motor can easily be achieved by connecting a reversing relay to the Soft Starter. The reversing relay type SRC 3 DX will determine the direction of rotation Forward or Reverse and the Soft Starter type SMC 3/32/33 will perform soft-starting and soft-stopping of the motor. If soft-stop is not required the application can be simplified by connecting the control circuit of the Soft Starter to the main terminals as shown under Line Controlled Soft-Start. A delay of approx. 0.5 sec. between forward and reverse control signal must be allowed to avoid influence from the voltage generated by the motor during turn Off.

Thermal overload protection (see also page 44)

Optional thermal overload protection is possible by inserting a thermostat in a slot on the right hand side of the contactor. Type number UP62

The thermostat can be connected in series with the control circuit of the contactor. When the temperature of the heatsink exceeds 90°C the soft starter will switch Off.

Note: When the temperature has dropped approx. 30°C the contactor will automatically be switched on again.

The thermostat is connected in series with the control circuit of the main contactor. When the temperature of the heatsink exceeds 90°C the main contactor will switch Off.

Note: A manual reset is necessary to restart this circuit.

Utilisation Categories EN60947-4-2

Category AC-53: Starting, switching off motors during running

Category AC-4: Starting, plugging, reversing the motors rapidly while the motor is during.

Mounting and cable wiring information

Mounting information see page 44 / Cable wiring see page 45

3-Phase electronic motor contactor (SMC 3 DOL Direct On Line)

- For Direct On Line start of 3 phase motors
- Rated operational voltage up to 600 VAC 50/60 Hz
- Rated operational current up to 15A AC-53
- Control voltage: 24-60VDC / 24-480VAC
- High number of start/stop operations / hour
- LED Status indication
- Meets EN 60947-4-2 requirements
- Requires only 45 mm DIN rail space

3-Phase electronic motor contactor (SMC 3 DOL Direct On Line)

Wiring specifications

SMC 3 DA XX15 DOL

11-12: For UP62 or other wiring purposes

Short-circuit protection by circuit breaker or fuses

Two type of short-circuit protection can be used:

- Short-circuit protection by circuit breaker.
- Short-circuit protection by fuses.

Short-circuit protection is divided into 2 levels **Type 1 or Type 2**

Co-ordination Type 1: Short-circuit protects the installation

Co-ordination Type 2: Short-circuit protects the installation and the semiconductor inside the motor controller

a) Short-circuit protection

Co-ordination type 1 will be obtained when using magnetic circuit breakers or standard gL/GI fuses.

Co-ordination type 2 will be obtained when using semiconductor fuses. When using semiconductor fuses the SCR will not be damaged due to transients and short circuits. The table indicates suitable fuses for co-ordination type 2 protection.

b) Short-circuit protection by fuses

Type 1: SMC 3 DA XX15 DOL Protection max. 50 A gL/gG

Type 2: SMC 3 DA XX15 DOL Protection max. i^2t of the fuse 1800 A²s

Fuses from e.g. Ferraz, Siba, Bussmann can be used as short-circuit protection Type 2

More information concerning Co-ordination Type 2 see page 45

Thermal overload protection (see also page 44)

Optional thermal overload protection is possible by inserting a thermostat in a slot on the right hand side of the soft starter. Type number UP62

The thermostat can be connected in series with the control circuit of the soft starter.

When the temperature of the heatsink exceeds 90°C the soft starter will switch Off.

Note:

When the temperature has dropped approx. 30°C the soft starter will automatically be switched on again.

The thermostat is connected in series with the control circuit of the main contactor.

When the temperature of the heatsink exceeds 90°C the main contactor will switch Off.

Note:

A manual reset is necessary to restart this circuit.

SMC 3 DOL General application information

The SMC 3 DOL has been developed for cranes and other harsh applications where inching, jogging and plugging is frequently used and where a high number of operating cycles are essential. In such applications the lifetime of the equipment is normally limited by the short lifetime of the electromechanical contactor. Electromechanical contactors are not designed to switch off motors in locked rotor- or overload conditions where the current is 6 times the nominal operational current (AC-4). The severe arcing will burn the contact elements resulting in unreliable contact function. The Semiconductor Contactor will close the contacts in the zero crossing of the mains voltage and switch-Off will always occur in the zero crossing of the motor current in this way voltage kickback from the inductive motor windings is avoided. The lifetime, therefore, of the Semiconductor Contactor will always be at least one decade longer than the electromechanical contactor.

Overload Protection in Motor Control Reversing

Overload protection of the motor is easily achieved by installing a manual thermal magnetic circuit breaker on the supply side of the motor.

The circuit breaker provides means for padlocking and the necessary clearance for use as a circuit isolator according to EN 60204-1.

Adjust the current limit on the MCB according to the rated nominal current of the motor

*Use UL approved Magnetic Circuit Breaker or UL specified back-up fuse type K5 or H Class

Comparison of lifetime in different utilization categories

Utilization-categories	Typical applications	Electro-mechanical Contactor	Semiconductor Contactors SMC3DA....DOL
AC-52a	Control of slip-ring motors, starting, switching Off	0.7 Mill. Cycles	25 Mill. Cycles
AC-53a	Control of squirrel-cage motors, starting, switching Off	1.3 Mill. Cycles	25 Mill. Cycles
AC-4	Control of squirrel-cage motors, starting, plugging, inching	0.06 Mill. Cycles	5 Mill. Cycles

1 Phase electronic contactor (SC 1)

- Rated operational voltage up to 690VAC 50/60 Hz
- Rated operational current up to 15/30A/50/63A AC-1
- Control voltage from 5-24 VDC or 24-230 VAC/DC
- Compact modular design 22.5, 45, or 90 mm
- LED Status indication
- Meets EN 60947-4-3 requirements
- Requires no additional components
- Built-in varistor protection
- IP-20 Protection

Thermal overload protection (see also page 44)

Optional thermal overload protection is possible by inserting a thermostat in a slot on the right hand side of the electronic contactor. Type number UP62

Example 1

The thermostat can be connected in series with the control circuit of the electronic contactor. When the temperature of the heatsink exceeds 90°C the electronic contactor will switch Off.

Note:

When the temperature has dropped approx. 30°C the electronic contactor will automatically be switched on again.

Example 2

The thermostat is connected in series with the control circuit of the main contactor.

When the temperature of the heatsink exceeds 90°C the main contactor will switch Off.

Note:

A manual reset is necessary to restart this circuit.

Common Short Circuit Protection RC 11 DX XX15

Dimensions (see also page 44)

Type	H	D	W
22.5 mm module	94 mm	124.3 mm	22.5 mm
45 mm module	94 mm	124.3 mm	45 mm
90 mm module	94 mm	124.3 mm	90 mm

Mounting and cable wiring information

Mounting information see page 44 / Cable wiring see page 45

1 Phase electronic contactor (SC 1 L for domestic applications)

- Electronic contactor for use in domestic applications
- Rated operational voltage up to 480VAC 50/60 Hz
- Rated operational current up to 30 or 50A AC-1
- Control voltage from 24-230 VAC/DC
- Compact modular design 45 or 90 mm
- Meets EN50081-1 / EN50082-2 requirements
- Built-in varistor protection
- IP-20 Protection

Item selection and technical specifications

Load AC-1/51 Heating- element	Load AC-3 Motor	Load AC-55b Lamp	Load AC-56a Trans- former	Control voltage	Item number by 110-230VAC 50/60Hz Line Voltage	Item number by 380-415VAC 50/60Hz Line Voltage		Module- width

Short-circuit protection by fuses

Two type of short-circuit protection can be used:

Short-circuit protection by fuses

Short-circuit protection is divided into 2 levels **Type 1** or **Type 2**

Co-ordination Type 1: Short-circuit protects the installation

SC 1 DX 2330 L Protection max. 50A gL/gG

SC 1 DX 2350 L / 4030 L Protection max. 50A gL/gG

Co-ordination Type 2: Short-circuit protects the installation and the semi-conductors inside the motor controller

SC 1 DX XX30 Protection max. i^2t of the fuse 1800 A²S

SC 1 DX XX50 Protection max. i^2t of the fuse 1800 A²S

Fuses from e.g. Ferraz, Siba, Bussmann can be used as short-circuit protection Type 2

More information concerning Co-ordination Type 2 see page 45

Thermal overload protection (see also page 44)

Optional thermal overload protection is possible by inserting a thermostat in a slot on the right hand side of the electronic contactor. Type number UP62

Example 1

The thermostat can be connected in series with the control circuit of the electronic contactor. When the temperature of the heatsink exceeds 90°C the electronic contactor will switch Off.

Note:

When the temperature has dropped approx. 30°C the electronic contactor will automatically be switched on again.

Example 2

The thermostat is connected in series with the control circuit of the main contactor.

When the temperature of the heatsink exceeds 90°C the main contactor will switch Off.

Note:

A manual reset is necessary to restart this circuit.

Mounting and cable wiring information

Mounting information see page 44 / Cable wiring see page 45

Applications hints SC 1 DA L

1-Phase 230 VAC

SC 1 DA 2330 L = 6.9 kW Max

SC 1 DA 2350 L = 11.5 kW Max

1-Phase 400 VAC

SC 1 DA 4030 L = 12 kW Max

3-Phase with N / 230 VAC

3 x SC 1 DA 2330 L = 20.7 kW Max

3 x SC 1 DA 2350 L = 34.5 kW Max

3-Phase without N / 400 VAC

3 x SC 1 DA 4030 L = 36 kW Max

3 Phase electronic contactor (SC 3)

Wiring specifications

SC 3 DX XXXX

11-12: for UP62 or other wiring purposes

Short-circuit protection by fuses

Two type of short-circuit protection can be used:

Short-circuit protection by fuses

Short-circuit protection is divided into 2 levels Type 1 or Type 2

Co-ordination Type 1: Short-circuit protects the installation

SC 3 DX XX10

Protection max. 50A gL/gG

SC 3 DX 4015

Protection max. 50A gL/gG

SC 3 DX XX20

Protection max. 50A gL/gG

Co-ordination Type 2: Short-circuit protects the installation and the semiconductors inside the motor controller

SC 3 DX XX10

Protection max. i^2t of the fuse 610 A²S

SC 3 DX 4015

Protection max. i^2t of the fuse 610 A²S

SC 3 DX XX20

Protection max. i^2t of the fuse 610 A²S

Fuses from e.g. Ferraz, Siba, Bussmann can be used as short-circuit protection Type 2

More information concerning Co-ordination Type 2 see page 45

EMC

This component meets the requirements of the product standard EN 60947-4-3 and is CE marked according to this standard.

This products has been designed for class A equipment. Use of the product in domestic environments may cause radio interference, in which case the user may be required to employ additional mitigation methods.

Mounting and cable wiring information

Mounting information see page 44 / Cable wiring see page 45

Thermal overload protection (see also page 44)

Optional thermal overload protection is possible by inserting a thermostat in a slot on the right hand side of the electronic contactor. Type number UP62

Example 1

The thermostat can be connected in series with the control circuit of the electronic contactor. When the temperature of the heatsink exceeds 90°C the electronic contactor will switch Off.

Note:

When the temperature has dropped approx. 30°C the electronic contactor will automatically be switched on again.

Example 2

The thermostat is connected in series with the control circuit of the main contactor.

When the temperature of the heatsink exceeds 90°C the main contactor will switch Off.

Note: A manual reset is necessary to restart this circuit.

Utilisation Categories (EN 60947-4-3)

Application hints analogue power controller for SPC 1

Control mode selection

Selection of control signal

The type of control signal, Current, Voltage or Potentiometer, can be selected on the rotary switch.

Protection

The control inputs are protected against overload. If the current exceeds 25 mA the loop will be switched Off and the LED's will indicate failure. The input will not be damaged if the 24 V supply by mistake is connected to the signal input. Control input terminals are marked with + correct polarity must be observed. The control input is floating.

Isolation Voltage:

Line to Control: 2.5kV AC

Isolation Voltage:

Supply to Control: 500V AC

Function mode selection

Phase Angle: Phase angle control is used for control of infrared lamps or heaters in IR heating applications

Two different operation modes can be selected.

Lin. Voltage: The load voltage varies linearly with the control signal

Lin. Power: The power delivered to the load varies linearly with the control signal.

Burst Firing

In Burst Firing mode full sine waves are supplied to the load. Consequently DC magnetising of the supply transformer is avoided. The number of sine waves varies linearly with the control signal.

Adjustable cycle times from 400 ms to 60 sec.

Line and load wiring hints for 1 or 3 phase application with or without neutral

Single Phase 230 / 400 V AC

Phase Angle and Burst Firing applications
230 and 400 V Heaters

SPC1AD 2330= 6.9kW/SPC1AD 4030= 12kW Max

Three Phase with Neutral

Phase Angle and Burst Firing for heater applications

3 x SPC1AD 2330 = 20.7kW Max
3 x SPC1AD 2350 = 34.5kW Max

Three Phase without Neutral Economy

With single pole contactor SC1DA4030 as slave.
Only Burst Firing applications.

SPC1AD 4030 + SC1DA 4030= 20.7kW Max
SPC1AD 4050 + SC1DA 4050= 34.5kW Max

Application hints analogue power controller for SPC 1

Different applications hints

Current Loop:

0-20 mA or 4-20 mA. Controller inputs must be connected in series

Voltage Control :

Controller inputs must be connected in parallel

Potentiometer Control :

10 kohm linear potentiometer

Control Supply :

Controller supply must be connected in parallel

Transformer applications hints

Transformer Loads

SPC1 load driving capability includes transformer applications which means that low voltage loads can be controlled via an isolation transformer without any surge or DC magnetising of the transformer

Switching Transformers

The problem in transformer switching is the magnetic circuit. When the transformer is switched Off, (H=0) the field (B) remains on a high level due to the high remanence of modern transformer core material. At initial turn-On where the remanence is unknown the SPC1 will soft-start to avoid the high current surge and at repetitive turn-on the switch-off polarity is "remembered" so next turn-on will be in the opposite polarity, thereby eliminating the high current surge normally seen in transformer applications. DC magnetising is eliminated by operating in full cycle mode only

Phase Angle Mode :

A initial turn On SPC 1 will soft-start the transformer to the voltage level set by the analogue input.

Burst Firing Mode :

A initial turn On SPC 1 will soft-start the transformer to full On mode. The controller will only allow full cycles to be supplied to the transformer hereby eliminating current surges and DC saturation of the transformer.

Transformer applications hints

Application Examples

The thermostat is connected in series with the control supply of the controller. When the controller heatsink temperature exceeds 90°C the control supply is switched Off. When the controller heatsink has dropped to approx. 60°C the control supply is switched On again.

Application Examples

The thermostat is connected to a PLC or other form of controller for controlled shutdown in case of over temperature

EMC Specifications

SPC 1 is in conformity with EN60947-4-3 AC Semiconductor Contactors for non motor loads

Burst Firing Control Mode:

No action necessary.

Phase Angle Control Mode: I < 10 A

No action necessary.

Internal filter is sufficient.

Phase Angle Control Mode: I > 10 A

Connect 1uF capacitor from N/L to L1 as shown above.

AC Auxiliary contact module (MAUX)

- Full-On monitoring of soft starters (SMC 3, SMC 33, STL)
- Function monitoring of Electronic Contactors (SC X)
- Function monitoring of motor reversing & motor contactors (SRC/DOL)
- Full-On/Off monitoring of Analogue Power Controller (SPC 1 AD)
- Dual Voltage range 230 VAC or 400 - 600 VAC 50/60 Hz
- Relay output (NO / NC) 5A 250VAC / 3A 24 VDC
- 22.5 mm module for DIN-rail mounting
- LED status indication
- IP-20 Protection

Item selection and technical specifications

MAUX 01 600 is an auxiliary module for monitoring the status of a connected motor controller or electronic contactor. If the sense voltage across the semiconductor on the connected controller (T3 and L3) is lower than 2 VAC the output relay is switched On (NC / 11-14). The output relay will open again (NO / 11-12) when the sense voltage is higher than 2.5 VAC.

Output specifications

Relay Output 5A 250 VAC (AC-22) 3A 24 VDC (DC22)

Line voltage range

T2.1 - T3 208 - 240 VAC 50/60 Hz Max 10 VA 1.5 W

Application example. soft starter type SMC 3 / SMC 33 with control of by-pass contactor

Control of by-pass Contactor (functional description): When the Control signal A1-A2 is supplied to the Soft Starter, Ram-Up is initiated. When the ramp time has elapsed the output relay in the MAUX1 will switch the by-pass contactor ON for limiting the power dissipation in the Soft Starter. When the control voltage is switched OFF the by-pass contactor will drop instantaneously, before the semiconductors are switched off, for eliminating severe arcing in the mechanical contactor. In this application the by-pass contactor can be selected from the thermal current Ith rating and not from the AC-3 rating.

GENERAL TECHNICAL INFORMATION

Fuse overview related to I²t values for each item. Co-ordination Type 2

In connection with the protection of soft starters and electronic contactors use of semiconductor fuses will protect the semiconductor inside the product in case of short circuits and reduce the potential of SCR damage due to transient overload currents. Fuses e.g. from Ferraz, Siba, Bussmann can provide you with suitable fuses. When selecting fuses ensure that the fuse has a lower total clearing I²t rating than the SCR as indicated under each type in this catalogue and that the fuse is able to carry the start current for the actual start duration. Normal fuses can be used to protect the installation (co-ordination type 1) in case of short circuit. See the actual useable fuse values as informed under each product.

Overload current profile in accordance with EN60947-4-2

Overload current profile (AC-53a without by-pass contactor) = X-Tx:8-3:100-3000	Overload current profile (AC-53b with by-pass contactor) = X-Tx:6-6:30
Utilization category ← AC-53a 8-3 100 3000 Overload capability: 8 x nominal current for 3 sec. ← Duty ratio in %: 100% = continuous operation ← Number of cycles / hour: 3000 cycles/hour ←	Utilization category ← AC-53b 6-6 30 Overload capability: 6 x nominal current for 6 sec. ← Time in seconds between each start operation ←

Utilization category explanation

AC-52a: Control of slip ring motor stators / **AC-52b:** Control of slip ring motor stators with the controller bypasses during running / **AC-53a:** Control of squirrel cage motors / **AC-53b:** Control of squirrel cage motors with the controller bypasses during running / **AC-58a:** Control of hermetic refrigerant compressors with automatic resetting of overload releases / **AC-58b:** Control of hermetic refrigerant compressors with the controller bypassed during running and with automatic resetting of overload releases.

NOTE: The means of bypassing the semiconductor controller may be integral with the controller/starter or installed separately.
